### Chapter 1

## Simplical sets and complexes

#### 1.1 Simplical sets

Let  $\Delta$  be the category of finite ordinal numbers, with order-preserving maps between them. More precisely, the objects for  $\Delta$  consist of elements  $\mathbf{n}, n \geq 0$ , where  $\mathbf{n}$  is a string of relations

$$0 \to 1 \to 2 \to \cdots \to n$$

(in other words  $\mathbf{n}$  is a totally ordered set with n+1 elements). A morphism  $\theta : \mathbf{m} \to \mathbf{n}$  is an order-preserving set function, or alternatively a functor. We usually commit the abuse of saying that  $\Delta$  is the ordinal number category.

A simplicial set is a contravariant functor  $X:\Delta^{op}\to \mathrm{Sets},$  where Sets is the category of sets.
